Problem 1

a.

```
procedure coeff(a, p):
    set i to 1

    while i <= avail:
        if a.expon[i] == p:
            return a.coef[i]
        end if

        set i to i + 1

    end while

    return -1
end procedure
```

b.

i. 4(One Integer) $*100$(100 terms) $*2$(member in the struct(power and coef)) $=800$bytes

ii. 4(One Integer) $*3$(3 terms) $*2$(member in the struct(power and coef)) $=24$bytes

iii. 4(One Integer) $*2$(2 terms) $*2$(member in the struct(power and coef)) $=16$bytes

c.

Yes, it saves space when it is sparse. But if the polynomial is not sparse, it costs a lot of time because it runs $O(n)$ to get coefficent which n is the non-zero terms in the polynomial.
